\* At  $Q_{nom}$  pressure drop will be approximately 1 bar (14 psi) for H<sub>2</sub>O. Sensors can be operated at higher flow rates but pressure drop will be higher. Maximum recommended velocity (liquid) through the sensor is 15 m/s. Beyond this point, cavitation may occur.  $Q_{min}$  is the recommended lowest flow rate. Sensors will measure flow rates lower than  $Q_{min}$ , but uncertainty may increase beyond 0.5% of rate.

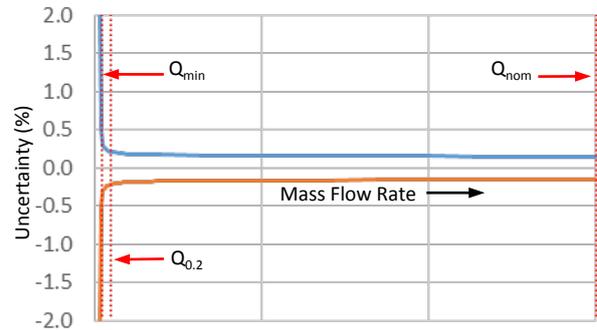

These flow rate and pressure drop statements relate to standard pressure tube sensor versions. Models with higher pressure ratings have increased wall thickness and will have higher pressure drops and lower  $Q_{nom}$  values.

## Measurement Performance

### Standard Calibration

A	<b>0.5% Uncertainty</b> ±0.5% uncertainty between $Q_{nom}$ and $Q_{min}$
B	<b>0.2% Uncertainty</b> ±0.2% uncertainty between $Q_{nom}$ and $Q_{0.2}$

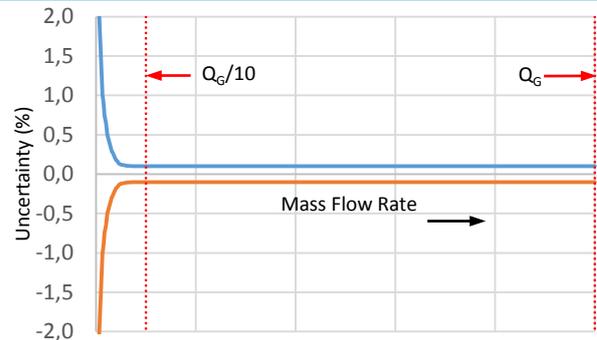

Higher pressure units may have lower  $Q_{nom}$  values due to reduced tube ID

### Goldline Calibration

G	<b>0.15% Uncertainty</b> ±0.15% uncertainty between $Q_G$ and $(Q_G/10)$
---	---

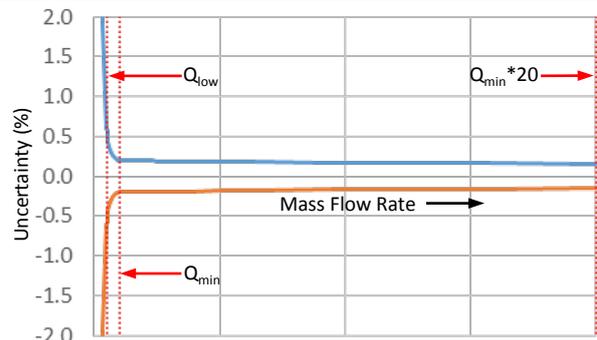

Only for sensors with standard temperature and pressure range  
Customized calibration services are available – consult factory

### Low Flow Calibration

2	<b>Low Flow Optimized Calibration</b> ±0.2% uncertainty between $Q_{min}$ and $(Q_{min} * 20)$ and ±0.6% uncertainty between $Q_{min}$ and $Q_{low}$
---	---

Only for sensors with standard temperature and pressure range

$Q_{nom}$	8000 kg/min (17637 lb/min)
$Q_{min}$	200 kg/min (441 lb/min)
$Q_G$	6000 kg/min (13228 lb/min)
$Q_{0.2}$	400 kg/min (882 lb/min)
$Q_{low}$	130 kg/min (287 lb/min)

Select the calibration option (A,B,G,2) required and include in the overall part number

### Flow Measurement Repeatability

Standard ± 0.1% of rate  
Goldline ± 0.05% of rate

### Temperature Performance

Better than ±1°C

### Density Calibration

N*	No Live Density Calibration
S	Standard +/- 0.005 kg/liter uncertainty between 500 and 1400 kg/m <sup>3</sup>
D	Enhanced +/- 0.0025 kg/liter uncertainty between 500 and 1400 kg/m <sup>3</sup>

For live volumetric flow, S or D calibration must be included in the part number and the sensor must be operated by an RHE with live density capability.

\* Even with No Live Density Calibration, volumetric flow can still be calculated with an inferred density value based upon a manually entered norm density value and its temperature gradient.

### Calibration Reference Conditions

Performance statements relate to the following conditions:

- Water (for mass flow accuracy)
- Temperature: 18 to 24°C (66 to 76°F)
- Pressure at 1 to 3 barg (15 to 45 psig)
- RHM with standard temperature, material and pressure range

## Measurement Tube Pressure Ratings

The maximum pressure ( $P_{max}$ ) of a sensor is determined by its lowest rated part. The lowest rated part can be either the measurement tube ( $P_{max}$  indicated below), the construction type ( $P_{max}$  indicated in the Part Number Code section) or the process connection (for  $P_{max}$  see published standards or manufacturer information).
